## **MORE:**

- 1) The **latest statistics on land and gender** you may wish to use from here( Making sense of land, statistics and gender)

<http://www.fao.org/3/a-bc244e.pdf>

[http://www.fao.org/gender-landrights-database/data-map/statistics/en/?sta\\_id=1168](http://www.fao.org/gender-landrights-database/data-map/statistics/en/?sta_id=1168)

*For instance, in Zimbabwe, 36% of all women and 36% of all men own land either solely or jointly with another family member. However, only 11% of women compared to 22% of men are sole landowners suggesting that when women own land they are more likely to share the ownership rights with another family member rather than being the sole holders of those rights.*

## **2) Gender Inequalities in Ownership and Control of Land in Africa: Myths versus Reality ( IFPRI)**

It is clear that statements such as “less than 2 percent of the world’s land is owned by women” or “women own approximately 15 percent of agricultural landholdings in Africa” are gross oversimplifications and are not substantiated by any of the available data. Yet, across countries, the pattern that women own less land than men, regardless of how ownership is conceptualized, is remarkably consistent. Further, in many cases, the gender gaps are quite large.

The various analyses presented in this paper provide new insights into the gendered patterns of landownership. Our best estimates from a review of 16 large-scale microstudies indicate that women are 29 disadvantaged relative to men in nearly all measures of landownership and bundles of rights; however, the gender gap varies widely. These statistics are typically more equitable for management indicators, or for land with use or access rights only; they are less equitable for indicators based on reported or documented ownership. An eight-country analysis from the FAO’s Gender and Land Rights Database shows that women account for an average of 24 percent of agricultural landholders (although this ranges from 3.1 percent in Mali to 50.5 percent in Cape Verde). Data from 10 DHS surveys show that as a country-level average, 39 percent of women own land individually, and 12 percent of women own land jointly, in contrast to 48 and 31 percent of men, respectively. Analysis of LSMS-ISA from six countries shows that of the total land area owned or accessed by households, women solely own (documented and undocumented) a high of 31 percent in Malawi, followed by Uganda (16 percent), Tanzania (15 percent), Niger (8 percent), and Nigeria (less than 1 percent). Comparatively, men solely own, on average, 99 times as much land area as women in Nigeria, and between 1.1 to 6.9 times as much land area as land solely owned by women in the other countries. These findings, as well as the analysis process, point to the following conclusions and recommendations for improving research and policy on women’s landownership in Africa

## **3) Top 10 reads on gender and land tenure**

## ***What are we actually talking about when we refer to women's land rights?***

In the lead up to the Global Landscapes Forum event, [This land is our land: Perspectives on land access and restoration](#), Thrive asked the International Food Policy Research Institute (IFPRI) to share ten essential articles for gaining an understanding of the key issues in gender and land tenure.

### **4) 70% of world's hungry are women, says UN expert on right to food**

GENEVA (8 March 2016) – “Women account for 70 per cent of the world's hungry, and are disproportionately affected by malnutrition, yet they are responsible for more than half of global food production,” said the United Nations Special Rapporteur on the right to food, Hilal Elver.

“Faced with discrimination on multiple levels, women's right to access food is affected at all stages of life. Indeed women in many countries receive less food than their male partners, as a result of their lower social status,” said Ms. Elver launching her latest report\* to the UN Human Rights Council. “Social segregation based on gender, when combined with other forms of discrimination grounded on religion, race, ethnicity, class and caste, disadvantage women even further,” added the expert.

“Despite their critical contribution to world food and agricultural production, women face difficulties in maintaining household incomes due to increased competition with imported agricultural goods, reduced prices, and declining commodity prices in international market, as well as in engaging in market activities when cultural norms make it socially unacceptable for them to interact with men. Migrant women workers with precarious immigration status and indigenous women are particularly vulnerable,” said the Special Rapporteur.

“Closing the gender gap in agriculture requires the development of gender-sensitive policies. Ensuring land rights, reinforcing the rights of girls and women to education and social protection and increasing women's participation in decision-making in a meaningful manner are critical”, stressed the independent expert.

*Page 4. ( from the report)*

*6. Although women produce and provide food they are often the last ones to access food for themselves. Women tend to remain invisible in decision-making processes and women are rarely an individual rights-holders, rather than a community members, mothers, farmers or care givers. Indeed, gender gaps are observed in access to all productive resources, such as land, seeds, fertilizers, pest control measures and mechanical tools, credit and extension services. According to the Food and Agricultural Organization of the United Nations (FAO), “...inequalities between men and women in their access to productive resources, services and opportunities are one of the causes of underperformance in the agriculture sector, and contribute to deficiencies in food and nutrition security, economic growth and overall development.”<sup>7</sup>*

*7. Improving this situation for women would lead to important advantages for society as a whole. It is estimated that closing the gender gap in agricultural yields would increase agricultural output in developing countries by between 2.5 and 4 percent. This in turn, could reduce the number of undernourished people in the world in the order of 12–17 percent, or as much as 150 million people.<sup>8</sup>*
